

High efficiency - JL Goslar lead anodes for metal extraction

Application & Products

Our anodes from lead and lead alloys are used in all areas of galvanic technology. In this area we differentiate between anodes for metal extraction and anodes for surface finish.

The 'anodes' business unit is specialized in the area of anodes for metal extraction. We continuously exchange ideas with research and technology and develop strong concepts for the optimum use of our lead anodes in your electrolysis operations.

High quality with no compromises.

We have been using our expert knowledge in the area of metallurgy in the production of anodes for electro winning of metals for many decades.

With our complete lead anodes and anode plates for metal extraction electrolysis we are responding to the growing requirements surrounding the quality and cost effectiveness of components as well as the individual customer requirements.

There is no limit to the analysis in our in-house metal laboratory and manufacturing in our modern production line. The production of the anodes will be made in all the required alloys and in every required dimension - in exact accordance with the requirements of our customers.

BENEFITS

- customized production of the lead alloys
- high density
- defined grain structure
- high deformation resistance
- high corrosion resistance
- rapid formation of the PbO₂- and MnO₂- layer
- low electricity consumption
- long lifetime of the anodes and therefore higher productivity in the use of the production plant

Full service range

One key element in enhancing your value added chain is our 'Full service recycling program' for used anodes. This 100 per cent recycling concept completes the cycle for valuable metals on a sustainable basis and offer you a further element for the cost-effective production of new lead anodes for nonferrous metal extraction.

Comfortable handling

We deliver functional solutions from the packing on transport pallets through to transport frames.

in safe hands
